Flow State

**A daily activity planner that fits movement
around real life**

The problem:

good intentions lose to busy mornings

Concrete example:

31% of adults worldwide

Around 1.8 billion adults did not meet recommended physical-activity levels in 2022.

Why this matters:

Many people need physical activity to be easier to fit into everyday life. For busy students, the decisions around timing, weather, and intensity can become another barrier.

The result:

The intention to be active never becomes a realistic plan. Flow State lowers this barrier by handling the planning.

<https://www.who.int/news/item/26-06-2024-nearly-1.8-billion-adults-at-risk-of-disease-from-not-doing-enough-physical-activity>

Observed friction:

1

Checking multiple
calendars takes effort

2

Weather can invalidate a
chosen time

3

A fixed workout ignores
how the user feels

Intended users and boundaries

PRIMARY USER

Students and young professionals with changing schedules who already use Google Calendar and want a low-pressure way to move more often.

WHO IS IT NOT FOR?

The system does not prescribe exercise for injury recovery, medical conditions, severe mental distress, or unsafe outdoor conditions. Those situations need human or clinical judgment.

RELEVANT CONDITIONS OF USE

- A calendar with genuine free gaps
- Access to email and the daily form
- A location supported by weather data
- Enough mobility for a walk or run

The working n8n workflow

Input

Form submission

Context

All calendars +
weather

Decision

AI selects activity and
slot

Action

Calendar event

Output

Plan by email

12 connected nodes · automatic form trigger · AI node · meaningful calendar and email output

User input takes less than a minute

Every morning:

The user receives an email link and reports mood and energy on two 1–5 scales.

Why these inputs matter:

The check-in lowers the pressure. High energy can lead to a run, while low energy can lead to a manageable walk instead of treating the day as a failure.

Daily Check-in

Two quick questions so today's outdoor suggestion actually fits how you feel.

Mood *

☐ 1 - Very low

☐ 2 - Low

☐ 3 - Okay

☐ 4 - Good

☐ 5 - High

Energy *

☐ 1 - Very Low

☐ 2 - Low

☐ 3 - Okay

☐ 4 - Good

☐ 5 - High

The user answers two questions. Flow State handles the remaining planning automatically.

How the decision works:

The AI receives only feasible candidate windows. It compares the user's energy with forecast conditions and returns a structured choice: activity, start time, duration, and reason.

Why AI is necessary

Rules can filter impossible times. AI handles the combined judgment and writes a personalised explanation that changes with context.

Result:

SDG 3 relevance and problem-solution fit

SPECIFIC SDG ISSUE

Physical activity can support mental and physical well-being. Yet busy schedules, low energy, and planning effort can stop people from beginning.

HOW FLOW STATE RESPONDS

Flow State lowers the barrier by choosing a manageable outdoor activity and reserving a realistic time for it.

Why simpler alternatives fall short

- A reminder ignores availability.
- A fixed workout ignores mood and energy.
- A weather alert does not reserve time.
- Flow State combines all three contexts and completes the scheduling action.

Ethical risks and safeguards

WRONG RECOMMENDATION

Risk: Unsafe or unsuitable activity.

Safeguard: Validate data, apply safety limits, allow users to decline.

LATE OR FAILED WORKFLOW

Risk: Delays can make plans misleading.

Safeguard: Show timing clearly and log failures.

SENSITIVE PERSONAL DATA

Risk: Mood, energy, calendar, and location are private.

Safeguard: Collect only what's needed and minimize storage.

OVER-RELIANCE

Risk: Some situations need human support.

Safeguard: Escalate serious concerns to a trusted person or professional.
